Western Star Bodybuilder Book: Revision 3.2b Western Star Star 4700 Identification - Legacy vs. Enhanced

2722-2742

The 4700 truck has been redesigned to incorporate many new features. In this entire document, the existing 4700 will be labeled "4700 L" (for Legacy) and the new vehicle, which is called the 4700 Enhanced, will be labeled as "4700 ENH". Shown on this page are some of the key identifying features to establish which version you have.

Features:

- Contour improvements and congruent look
- More modern gauge/instrument layout
- Door pockets with wrap around hand points
- Updated instrument cluster and gauges provides more information to the driver in an intuitive format
- Multi-function LCD readout:
 - MPG
 - Gear indicator (DT12 & Eaton Only)
 - Trip info
 - Outside temperature
 - Heading
- Steering Wheel:
 - Controls for cruise control, radio, headlight on/off, phone, LCD display
 - Hands on the wheel, eyes on the road" steering wheel controls
 - LCD Display
- Steering Column:
 - Adjustable
 - Turn signal with integrated wiper control
 - Shift controls (DT12)
 - Engine brake using the selector stalk

Western Star Bodybuilder Book: Revision 3.2b Dash Mount Device Prep

Top of dash navigation prep with power and ground

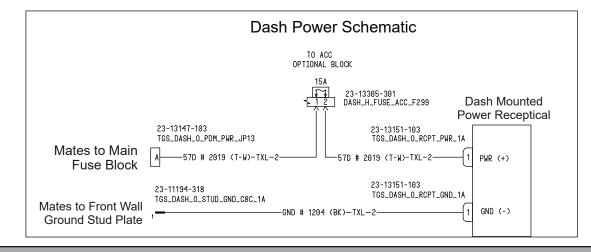

1U1-001 - Dash Mount Device Prep

This new option provides a standard bolt pattern in the dash for a 1" RAM ball mount system or other camera mount equipment. These mountings allow customers to quickly mount a variety of electrical devices ranging from navigation systems to cell phone holders in a road legal and easily accessible location without drilling the dash. Mounting solutions for most devices can be found on the RAM website. Navigation and camera systems cab be consistently mounted to factory installed mounts with no cab modifications. This industry leading solution allows customers to easily upgrade to new systems as fast as they become available to the market. The Nav prep system is superior to in-dash navigation as it allows owners or drivers to easily add their own devices such as smartphones for hands free and navigation or full navigation and backup systems. Today's technology is moving quicker than in-dash systems can keep up with. Using the Western Star Navigation prep your equipment can be easily upgraded to the latest hardware in minutes.

Western Star Bodybuilder Book: Revision 3.2b Backup Camera and Backup Radar

Camera and Radar Systems

Western Star offers factory Pre-Delivery Installation (PDI) installed camera and radar packages for improved safety and efficiency on the job site. Choose from three different systems using the data codes below or custom order your own configuration from Daimler Custom Truck. All camera systems have built in looping DVR recorders that constantly record drivers actions and surrounding environment. Radar systems use proximity radar and tell operator how to close the object is and give an audible alarm if objects move into the path without the drivers noticing.

Western Star Bodybuilder Book: Revision 3.2b **Power Cutoff Switches**

Positive Disconnect Switch

In-cab disconnect switches are offered in "locking" or "non-locking" configuration.

Exterior battery mounted switches will be offered in the locking configuration only.

Cutoff switches are equipped with red LED lights, which are illuminated when power is on.

Trucks equipped with the body builder auxiliary power system will have an additional LED light on the switch.

Note:

- 1. Both PNDB units will be deactivated when the switch is in the off position.
- 2. Positive disconnect switches do not isolate the starter.

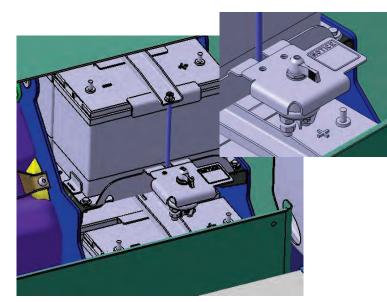

Negative Disconnect Switches

The negative disconnect switch option is for use in emergency and dangerous goods applications only. This option provides a battery box disconnect between the starter and the batteries. This option is currently only available with Detroit Diesel engine configurations.

Power Net Distribution Box (PNDB)

The PNDB is a new power delivery system for the WST and is designed to deliver more consistent and better protected battery power to the other components on the truck.

The PNDB also has protected "keep alive" circuits that will maintain power even with the cutoff switch in the off position. The primary reason for this change is to provide power to the 2010 DEF purge system which drains urea from the delivery system and prevents the system from freezing during cold conditions.

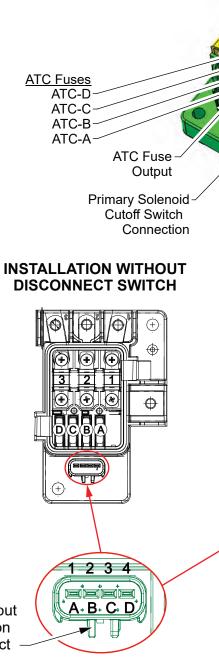

The PNDB located at the lower LH front wall area is equipped with three MIDI fuses which supply power to the Main Power Distribution Module. These fuse connections have been relocated from the battery in 2010 to prevent corrosion and improve the trucks reliability in severe conditions.

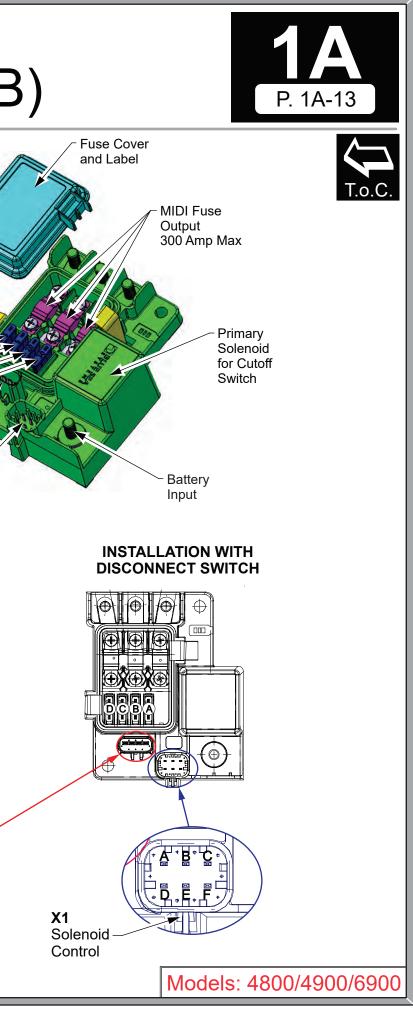

Fuse	Function	Rating	Max. Fuse Allowed	X2 Pinout
ATC-A	Afer Treatment ECU	30 AMPS	30 AMPS	1
ATC-B	Emergency Power	5 AMPS	30 AMPS	2

Western Star Bodybuilder Book: Revision 3.2b **Powertrain - Power Distribution Module**

Powertrain (PT-PDM) Module 286

The PT-PDM holds all of the powertrain related fuses and relays.

- Engine fuses/relays
- Transmission fuses/relays
- After treatment fuses/relays, except DCU main battery feed (located in PNDB)

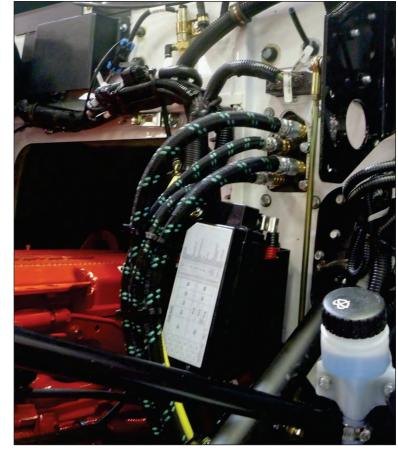

The power which supplies the PT-PDM is sourced from the Power Net Distribution Box (PNDB). It is important to note that the PNDB holds the bi-stable relay, which disconnects the battery when the relay is turned off at the PNDB output. PT-PDM power is not maintained by the alternator if the disconnect switch is "thrown". Therefore, the engine ignition relay, in the PT-PDM, will fall out and the engine will turn off.

Western Star Bodybuilder Book: Revision 3.2b **Dash Switches**

Durable and Flexible Marine Grade Switches

Western Star dash switches are designed for long haul and all weather conditions, these marine grade switches provide long term durability and dependability for customers and flexibility to body builders. Switch faces can easily be replaced and we have many custom options set up for you to create the finished operator controls.

Pre Labeled Additional Switch Options

- · WST offers many customized switch options to help the body builder add functionality and body controls.
- Western Star marine grade high current switches are designed for long term duty cycles under severe conditions.
- Listed to the right are some of the common switch options available that provide pre installed dash switches and wiring depending on the option selected.
- Switches are designed with a separate facing that attaches to the switch body.
- Custom switch facings can be selected and factory installed using the following switch label pages.
- Wiring schematics for these options are also located in this chapter, see Index.

For detailed switch option information, see Section 1D.

Complex Switch with Icon

Custom Switch Facing

New solutions can be created for multiple new units. If you do not see what you are looking for in the next few pages or need more information, contact your WST Dealer Sales contact and we can work with you to create a custom solution.

Western Star Bodybuilder Book: Revision 3.2b WST Gauges & RX Module

WST Star Gauge System

Beginning in April 2005, the PX and PX-A modules were replaced by air lines that are routed to each individual Star Gauge. These gauges convert the air pressure into an electrical signal. The Star Gauge databus supplies power, ground, and backlighting information for these gauges.

Beginning with EPA10 vehicles, the engine controller no longer offers a J1587 data bus. The engine, transmission, ABS, and most of the other optional electronic devices on the vehicle now communicate using J1939 protocol.

The EPA10 RX Module

This new redesigned module, incorporates functions of the earlier RX and PX modules in one unit that also performs a gateway function. The EPA10 RX module performs the following functions:

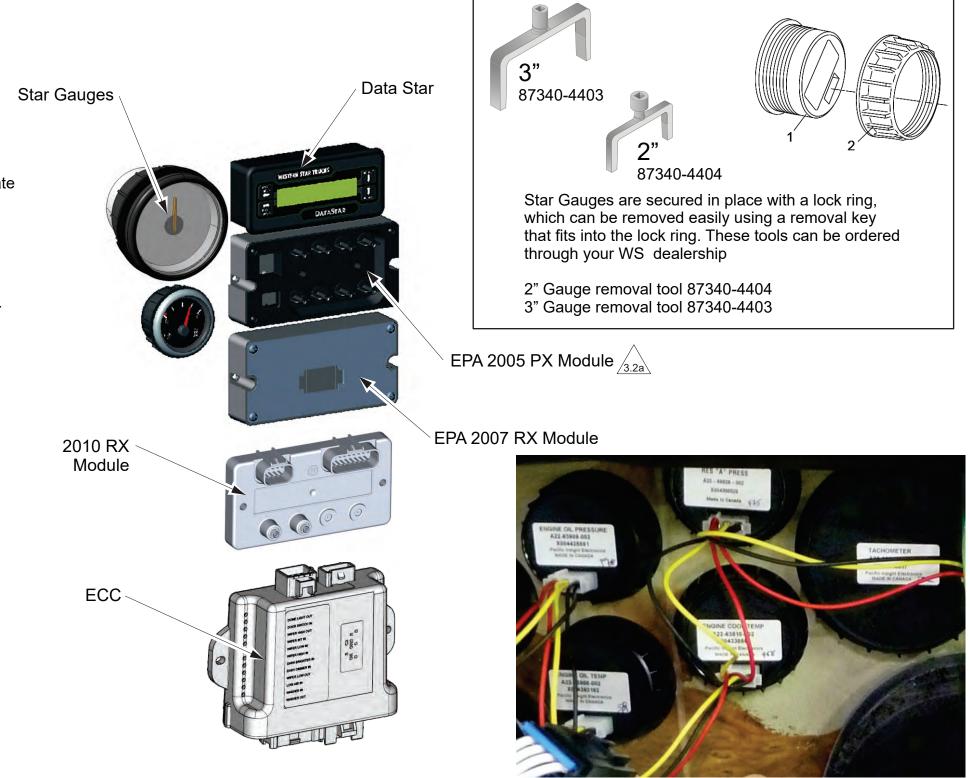

- Converts sensor and voltage inputs into the J1587 (PI Bus) data.
- Converts four air pressure inputs into J1587 (PI Bus) data.
- Gateway Function converts J1939 data that is required for the DataStar and the Star Gauges into J1587 protocol (PI Bus) data.

Note: The J1587 data network is also called the PI bus in some instances. The speedometer uses the J1587 data from the RX module as the source of data for the Star Gauges.

The DataStar is also on the J1587 (PI bus) network and uses this data. The RX gateway module is located on the underside of the cab below the steering shaft, near the clutch linkage.

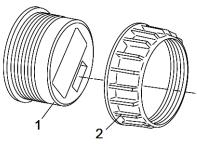

24 to 12 Volt Converter

The 24 to 12 volt converter is used on vehicles with 24 volt electrical systems. It is connected between the speedometer and the dash wiring harness and reduces voltage to 13.5 volts, which is needed by the Star Gauge and DataStar system.

Western Star Bodybuilder Book: Revision 3.2b J1939 Connection

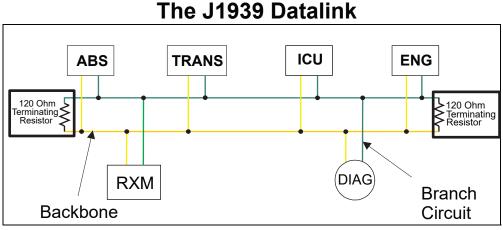

Cab resistor located in dash 10" back from frontwall engine connection

Front Wall Engine connection 40 pin 48/49/6900 76 pin 4700

Resistor Receptacle Part FTL# 23-13303-902 Deutsch # DTM04 - 2P - EP10

WST J1939 System Connections

J1939 Connections

Tying into the J1939 backbone is accomplished by tapping into the system resistor tee's located at each end of the backbone.

The Chassis terminating resistor is located in a tee along the left frame rail, usually behind the cab.

The cab terminating resistor is located in the dash tapped 10" back from the Front Wall engine plug harness Under the dash (shown on the left). The correct datalink resistance measured at any device, or at the diagnostic plug should be 60 Ohms with the battery disconnected.

2015 and older Western Star units have a 250KB data rate interface at both the diagnostic plug and the center tie in points.

2016 and newer units have a new 500K J1939 interface for the diagnostic plug and main engine/transmission Signals. A 250KB gateway is provided for connecting to the system and is located at the center of the dash console near the RH side of the steering column.

IMPORTANT:

- It is essential that both terminating resistors remain connected to the ends of the J1939 backbone to dampen feedback signals. Numerous J1939 problems can be attributed to terminated that are missing or disconnected.
- If connections under dash become disconnected, connections should never be reconnected back together directly e.g., ABS with ABS as this creates an independent circuit in the system that is not connected to the backbone.

J1939 Connections for Body Builders

To connect easily to J1939 at dash location order the following parts:

(1) Tee and Jumper FTL# A06-37868-000 (1) Jumper Plug # DUFDTM06 2S E004 (2) Female Pins DUFWM2SB

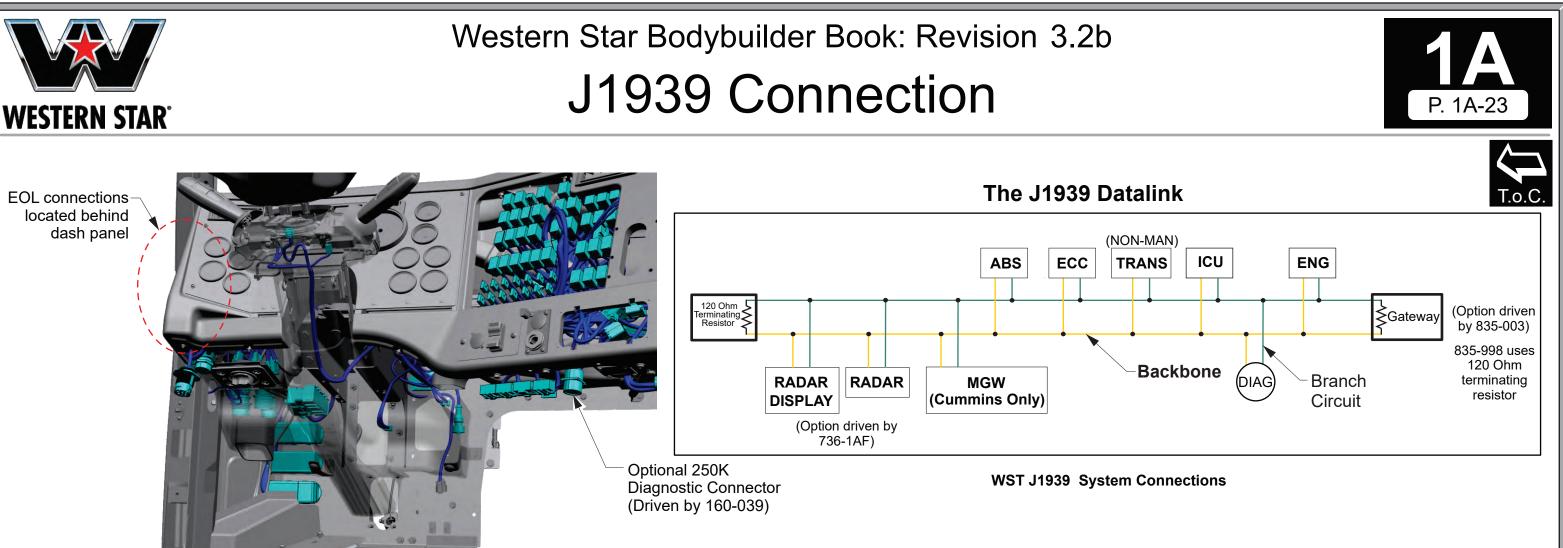

Models: 4700L/4800/4900/6900

Western Star Bodybuilder Book: Revision 3.2b J1939 Connection

EOL connections located behind dash panel

J1939 Connections

Tying into the J1939 backbone is accomplished by tapping into the system using the terminating resistor tee's located at each end of the backbone.

2016 and newer units have a new 500K J1939 interface for the diagnostic plug and main engine/transmission signals. A 250KB gateway is provided for connecting to the system, the optional secondary diagnostic plug to access the 250K network, is located at the center of the dash console beneath the switch panel.

IMPORTANT:

Terminating Resistor on J1939 500K

Backbone

- It is essential that both terminating resistors remain connected to the ends of the J1939 backbone to dampen feedback signals. Numerous J1939 problems can be attributed to terminated resistors that are missing or disconnected.
- If connections under dash become disconnected:
 - All J1939 500K circuits will be green/white striped and yellow/white striped wires.
 - All J1939 250K circuits will be solid green and solid yellow wires.
- Connections should never be reconnected back together directly e.g., ABS with ABS, as this creates an independent circuit in the system that is not connected to the backbone.

J1939 End of Line (EOL) Connections (Image referencing Cummins EOL)

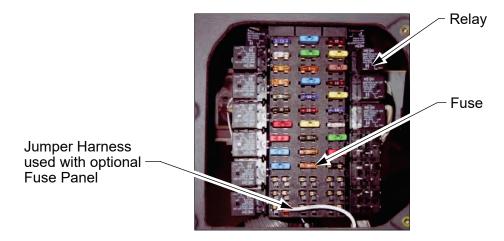

Models: 4700 ENH

Western Star Bodybuilder Book: Revision 3.2b **Fuse and Relay Blocks**

WST Fuse Panel

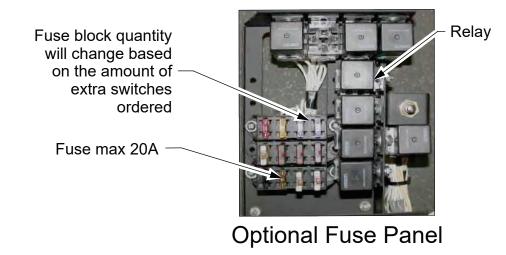

The WST Fuse Panel is equipped with 30 fuses, 14 relays, and 18 power jumpers. The fuse and relay locations are standard as shown but may be changed by engineering to accommodate new designs. Refer to the "Main Cab Harness" schematic in Mod 320 to find the specific information on these items. The fuse panel jumper slots provide for 18 additional power jumpers, which provide power.

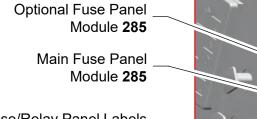

Main Fuse Panel

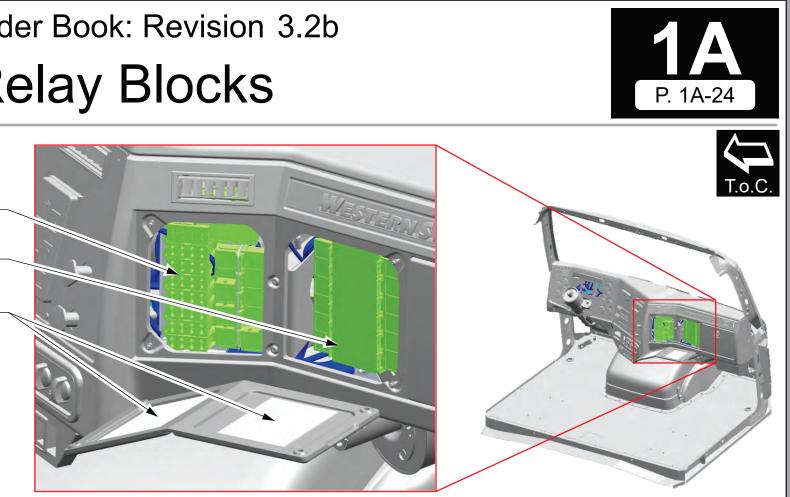

Optional Fuse/Relay Panel

Optional fuse panels are used to support additional switches and other custom options. The WST system is designed to support up to 24 fuses and 14 relays or, alternatively, up to 28 fuses and 10 relays. Additional fuse blocks and switches can be ordered for customer use, see the Section 1D for more information.

Note: Example fuse/relay panel labels shown. Refer to the labels on the vehicle for truck specific information. Labels located behind the dash covers.

Models: 4700L/4800/4900/6900

Western Star Bodybuilder Book: Revision 3.2b Fuse and Relay Blocks

Fuse / Relay Panels

The 4700 ENH models are equipped with three Power Distribution Modules (PDM): PDM 1, PDM 2, and PDM 3. The PDMs provide fuses and relays, which include:

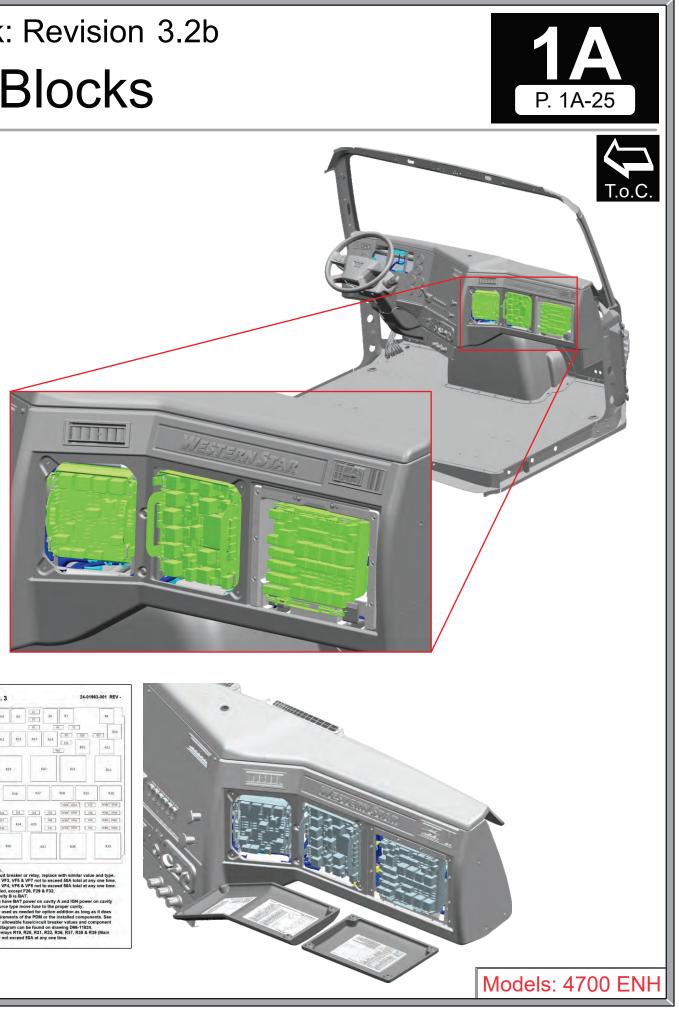

J-Case Fuse: (23-13969-0XX) *
Mini Fuse: (23-12537-0XX) *

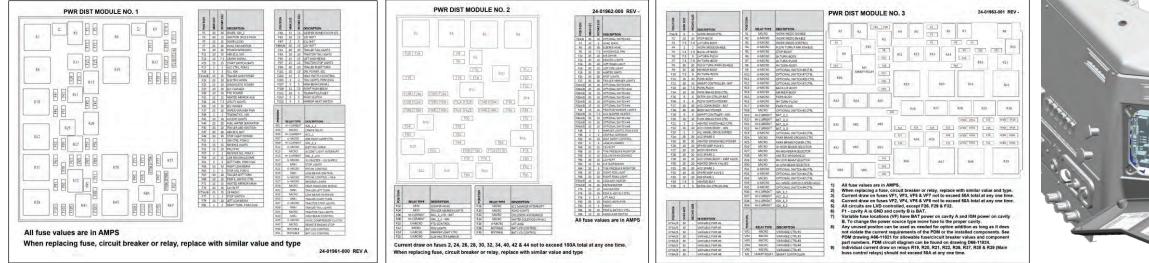

Circuit Breaker Type 1: (23-13125-2XX) *
Circuit Breaker Type 2: (23-13126-2XX) *

- Ultra Micro Relay: (23-13893-000)
- High Current Micro Relay: (23-13124-000)
- Mini ISO Relay 4-Pin: (23-11276-020)
- Mini ISO Relay 5-Pin: (23-11276-011)
- Bi-Stable Relay: (06-71082-000) (Located on the back of the PDMs)
- * Part numbers ending with -#XX are defined by the amperage rating. Reference service manual when replacing or adding these parts.

PDM Features

- PCB based dedicated printed circuit boards that electrically connect components using conductive traces. Boards are securely housed in special housings.
- Connector based interface with hardwired connectors. Allows ease of plugging-in/out for servicing.
- Low Voltage Disconnect (LVD) module integrated in PDM 1, controls features in all three PDMs.
- PDMs clipped on corresponding mounting brackets, allowing the PDMs to snap in and out for removal. PDM 1 and PDM 2 have fabric handles for easy removal. PDM 3 is mounted on a rotating bracket, providing access for servicing and customer additions (See section 1A-26).
- Dedicated labels for each PDM, located behind the dash covers. Labels include positioning and descriptions for the fuses and relays.

Three Cavity/Two Legged Fuse 2

/3.2a

/3.2b

Remove bolts

NOTES:

- 1. Any unused positon can be used as needed for option addition as long as it does not violate the amperage requirements of the PDM or the installed components. See PDM drawing and circuit diagram for allowable fuse/circuit-breaker/relay allocations.
- /2. Three cavity/two legged fuses have BAT power on cavity A and IGN power on cavity B on the configurable fuses located on PDM3. To change the power source type, move the fuse to the proper cavity. Middle cavity 3.2a provides output. See image. Refer to the PDM itself or the PDM label for cavity locations. Note: In some locations, Cav A is on the left, and in other locations, Cav B is on the left. $\sqrt{3.2b}$

Fuse and Relay Blocks - Service Bulletin

SS 1032982: WST 4700L/4800/4900/6900 3.2 Main Cab Harness Changes affecting Body **Builder Interface**

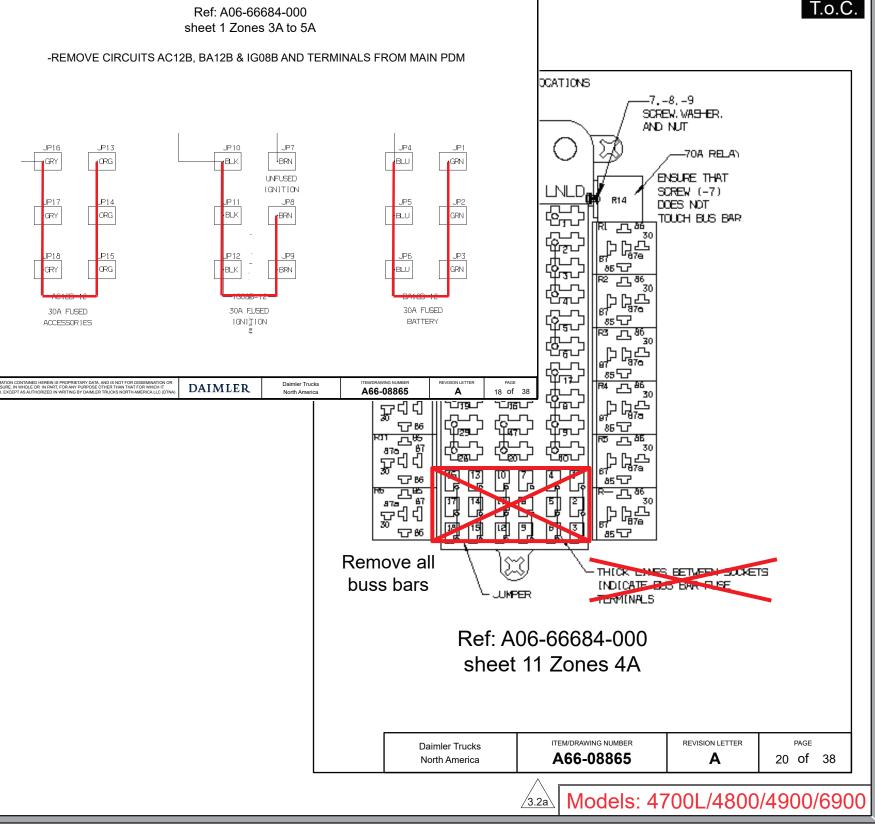

Symptom

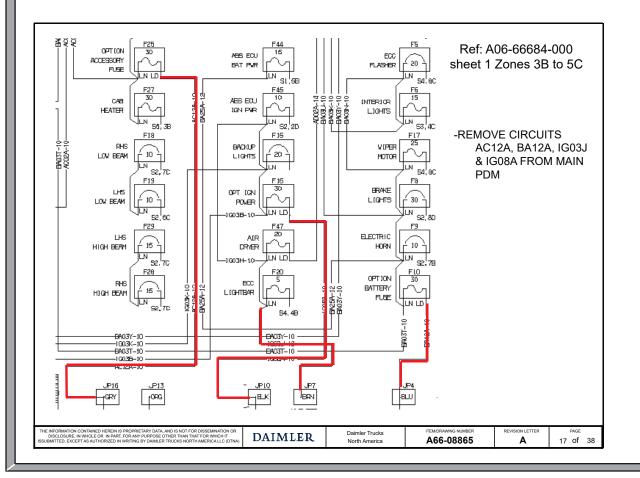

Cab Harness wiring used by the Body Builder interface has been relocated and the connections changed.

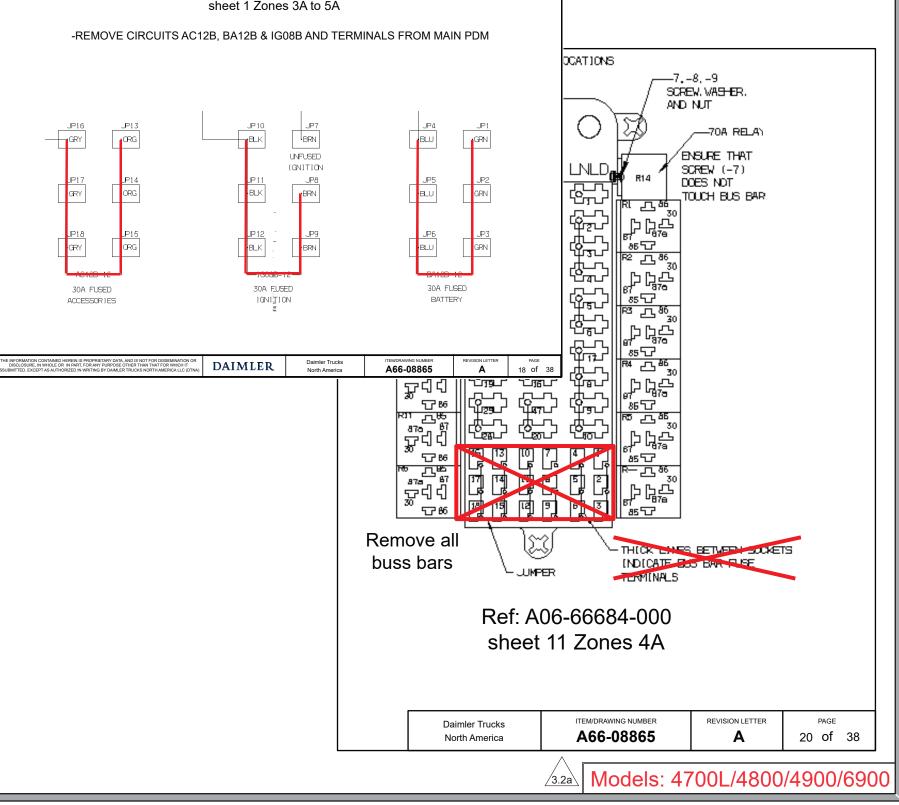

Issue

Recent design changes to Main Cab Harness applied extensive modifications to Main Cab Harness that included the removal of the JP Plugs (Jp1 thru Jp18) that provided ignition, accessories, and battery connection points.

Design changes were prompted due to JP connectors and terminals being discontinued and soon will not be available in the market. New Body Builder wiring interface points are being provided. Details of removed/added connectors are shown below.

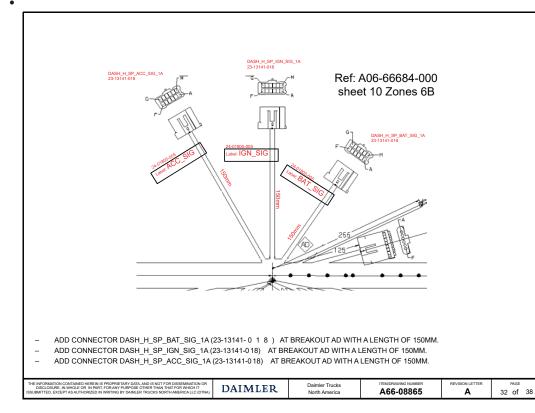

Western Star Bodybuilder Book: Revision 3.2b Fuse and Relay Blocks - Service Bulletin

Cont. from 1A-27.

Solution

New Main Cab Harness designs provide two different locations to plug in to get Ignition, Accessory, and Battery power supply as is shown below:

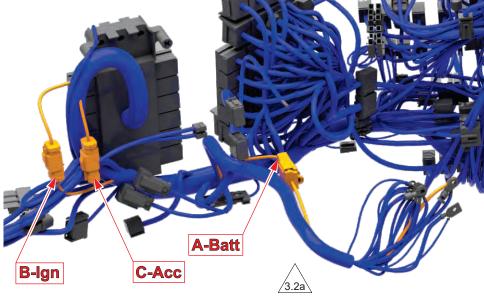

These are primary interface point for signal for low power, 3 new splice packs which are located behind the B-panel, along the main bundle, and will be labeled as BAT SIG, IGN SIG & ACC SIG. Any unused cavity can be used in these splice packs. The max load of each of the splice packs is 10A, so they are intended for small loads and control circuits. Any of the following terminals can be used: 23-13213-140 (18-16 AWG). It is recommended that wire size be limited to 18GA (0.8MM) due to connector lock limitations. However, a 15GA (1MM) wire will fit with a modification to the terminal lock (not recommended).

A second low power interface point is located near the 9-pin diagnostic connector on the LHS of the dash. It is labeled PWR SIG. This connection is supplied with a plugged black connector that can be used to pull a single power circuit for each type of power. These circuits are fed from the splice packs mentioned in section 3a, so the same power limitations apply. The Following terminals can be used: 23-13210-108 (18-16-AWG). It is recommended that wire size be limited to 18GA (0.8MM) due to current limitations. This 3-pin connector provides Battery (Cav A), Ignition (Cab B), and Accessory (Cav C).

New Main Cab Harness also provides new high power interface points. The new interface wires are shown in orange (not orange in real life). Here are the instructions on how to use these:

a) Battery: This BLACK connector (A) set is located along the RH dash support bracket behind the AUX PDM. This consists of a mated pair of 6-way connectors. The connector closest to the frontwall will be completely populated and is the power supply (wires labeled 14). It's mate will have open cavities and is used sort of like a splice pack. Any open cavity can be used and it is recommended that the output be limited to 60A per pin. The actual circuit will support slightly more, but that is the recommendation. Any of these terminals can be used based on wire size: 23-13211-330 (20-16 AWG), 23-13211-331 (14 AWG), 23-13211-332 (12 AWG), & 23-13211-333 (10 AWG).

Ignition and Accessory Connectors can be accessed removing the Glove Box cover; The Battery Connector can be accessed removing the Aux PDM or reaching from under the dash panel.

b) Ignition: This GRAY connector (B) set is located on the harness just behind the main PDM along the service loop. This consists of a mated pair of 6-way connectors. The connector closest to the PDM will be completely populated and is the power supply (wires labeled 52). It's mate will have open cavities and is used sort of like a splice pack. Any open cavity can be used, it is recommended that the output be limited to 30A per pin. Keep in mind that this shares power with both the main and auxiliary PDM's and total active load is limited to 70A. Any of these terminals can be used based on wire size: 23-13211-011 (16-14 AWG) and 23-13211-012 (12-10 AWG).

c) Accessory: This BLACK connector (C) set is located on the harness just behind the main PDM along the service loop. This consists of a mated pair of 6-way connectors. The connector closest to the PDM will be completely populated and is the power supply (wires labeled 305). It's mate will have open cavities and is used sort of like a splice pack. Any open cavity can be used and Engineering recommends that you limit the power to 30A per pin. Keep in mind that this shares power with both the main and auxiliary PDM's and total active load is limited to 70A. Any of these terminals can be used based on wire size: 23-13211-001 (16-14 AWG) and 23-13211-002 (12-10 AWG).

Please contact your DSM or our WST Field Service Team if you have comments or questions.

AUXILIARY PNDB Module 33P

Western Star Bodybuilder Book: Revision 3.2b In Cab Body Builder Connections

In Cab Body Builder PDM

- · Dedicated raceway to route wiring for body install
- Floor Tray accommodates (6) 1/2" bundles
- · Raceway system provides access cover to route wires
- · Cab access through access floor plate 4" pass-thru in cab floor
- · In-cab body builder fuse and relay system isolates body controls from truck system for a simple and more reliable truck and Body integration operation

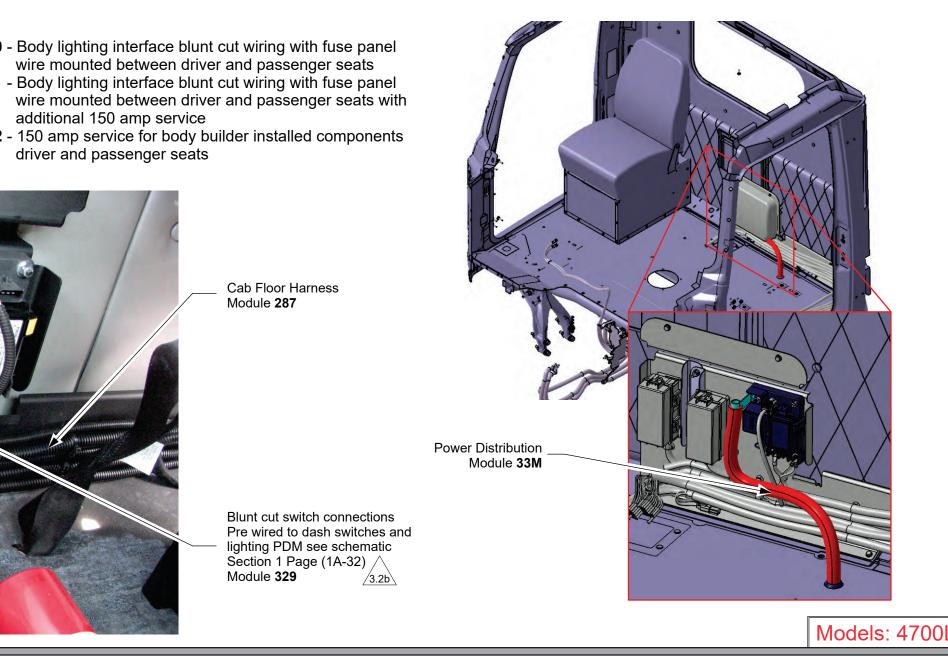

Body Builder PDM is Mandatory with the following high amperage switch options the PDM unit can be omitted in certain cases with these combinations where the body builder is supplying their own PDM (engineering review required)

329-068 - (4) 20 amp switches wired behind passenger seat 329-072 - (6) 20 amp switches wired behind passenger seat 329-076 - (10) 20 amp switches wired behind passenger seat

Note: The fuse panel option is not required in cases where Body Upfitters are installing their own PDM systems. If you are in doubt call ahead and check before ordering. If a PDM system will be installed order the

- **353-060** Body lighting interface blunt cut wiring with fuse panel wire mounted between driver and passenger seats
- 353-061 Body lighting interface blunt cut wiring with fuse panel wire mounted between driver and passenger seats with additional 150 amp service
- **353-062** 150 amp service for body builder installed components driver and passenger seats

Western Star Bodybuilder Book: Revision 3.2b Cab Passthrough & Raceway

Included with 329-1AU, 329-1AV, 329-1AW, 329-1AX, 329-064 329-068, 329-072, 329-076 and 353-060 Options

In Floor Tray Cover

Accessing the cab on the 4700 SF and SB is quick and simple using the floor access plate at the back of the cab. Look for cuts in the floor mat at the center of the cab. Under this flap is a cover plate which gives you structurally designed access from the chassis into the cab.

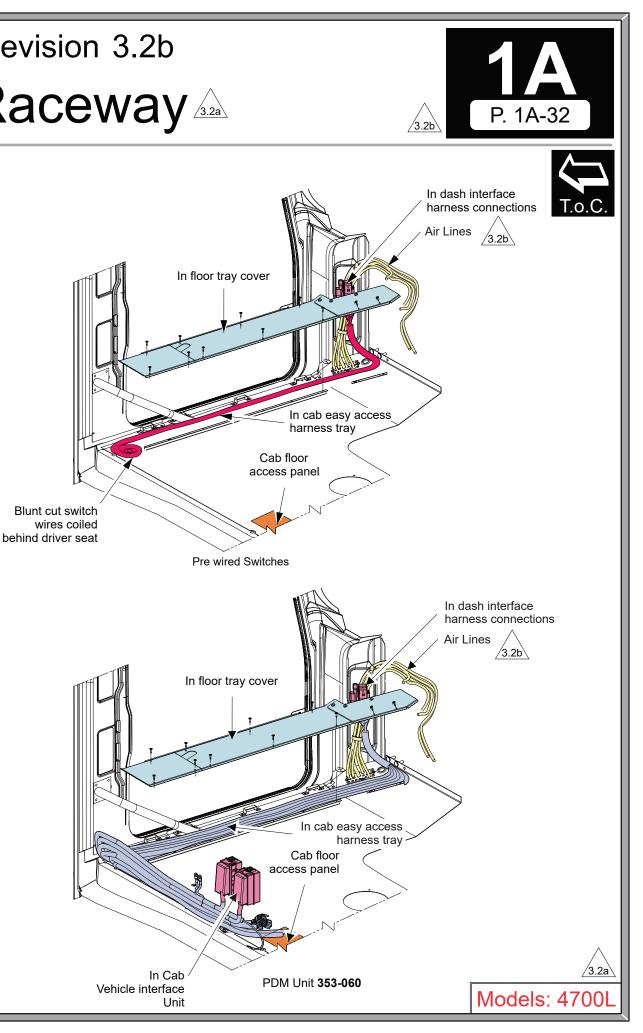

Plates can be removed from the unit and mounted at a workbench if desired for better sealing of cab mating harness.

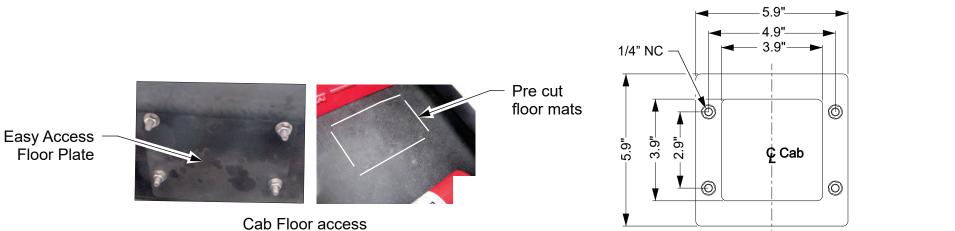

Pre-wired switch harness can be ordered using the option codes. /3.2b

Switches can be blunt cut wires or pre-wired to an independent relay box ready for your body connections

In cab connections are protected from the weather and corrosion

Pre-wired switches are routed in a tray at the driver side floor board. This tray allows you to safely route wires to the dash inside the cab and eliminates upholstery and interior damage along with assembly time.

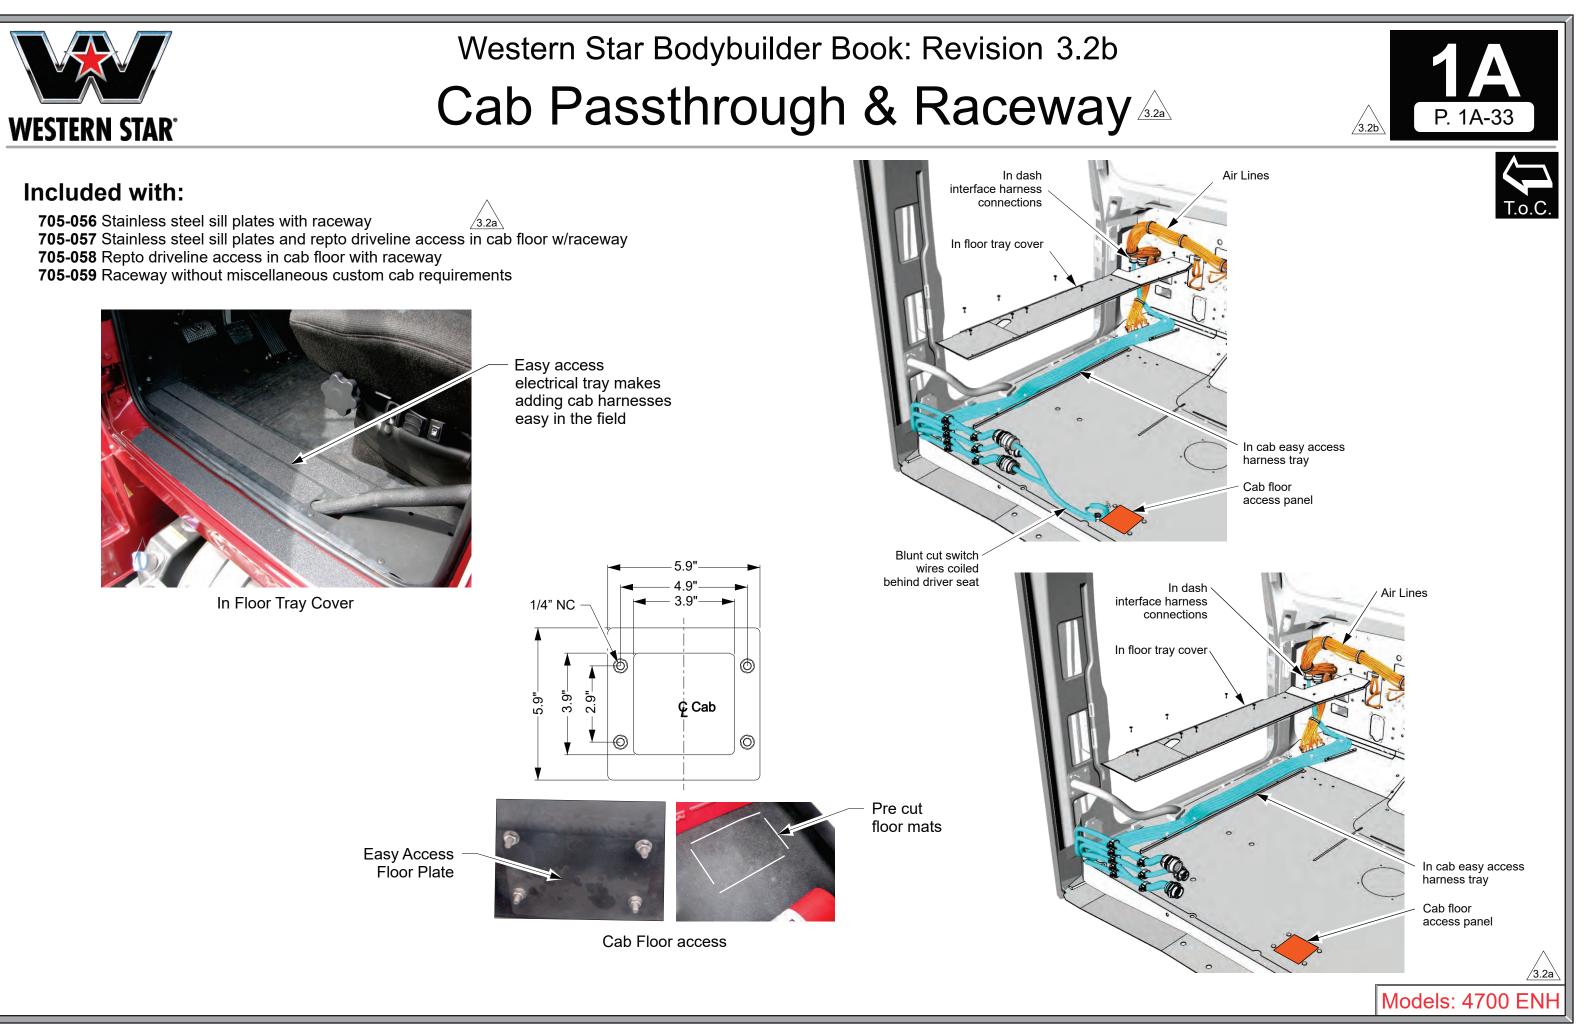

Easy access

easy in the field

Western Star Bodybuilder Book: Revision 3.2b **Daytime Running Lights - Discon/Recon**

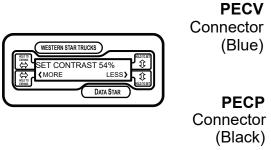

General Information

Western Star vehicles are built with DRLs enabled. If the vehicle is ordered with data code 311-998 (NO DAYTIME **RUNNING LIGHTS**), the DRLs are disabled during assembly. In most cases, wires are removed from the connector cavities to allow for future connection.

NOTE: Daytime Running Lights (DRLs) are required by law in Canada. Daimler Trucks North America recommends keeping DRLs operational in all locations, even where not required by law. The following instructions can be used to enable or disable DRLs where it is permissible to operate without day time running lights. IMPORTANT: If disabling the DRLs, do not cut the wires. Fold back and tape the wires to allow for connection in the future.

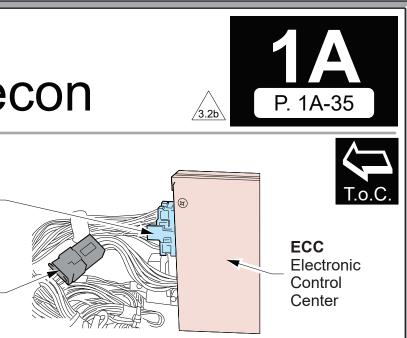

Vehicles without Star Gauge Dash, Built Prior to February 2002

- 1. Shut down the engine, set the parking brake, and chock the tires.
- **2.** Disconnect the negative leads from the batteries.
- 3. Remove the four screws that secure the instrument panel, then pull the top of the panel forward to access instrument panel wiring. On vehicles with fixed steering columns, remove the bolts that hold the steering column to the dash assembly to lower the steering column for access.
- 4. Disconnect the blue **PECV** connector from the left-hand side of the Electronic Control Center (ECC).
- 5. Note the cavity location of wire LB08A, then tag the wire with that location so that the daytime running lights can be easily connected, if necessary.
- 6. If connecting the DRLs, locate wire LB08A: the wire should be folded back and taped off in the harness. Remove the tape and install the wire into its tagged location, then continue with step 8. If the location is not tagged and the vehicle uses harness 873b1-3570, install wire LB08A into cavity D1, and continue with step 8.
- 7. If disconnecting the DRLs, remove wire LB08A from the connector, wrap the terminal end of the wire with electrical tape to prevent unintended connection, then secure the wire back to the harness with a tie-strap.
- 8. Connect the blue **PECV** connector to the **ECC**.
- 9. Disconnect the black PECP connector from the pigtail on the left-hand side of the ECC. The ECC pigtail to the black PECP connector has colored wires and mates to a headlamp harness connector with white wires.
- **10.** On the white-wire headlamp harness side of the connector, note the cavity location of wire **HL08** (**B**, **E**, or **G**), then tag the wire with that location for possible future installation.
- 11. If connecting the DRLs, locate wire HL08 (B, E, or G); the wire should be folded back and taped off in the harness. Remove the tape and install it into its tagged location. Continue with step 13. If the location is not tagged, and the vehicle uses harness 873b1-3570, install wire HL08 (B, E, or G) into cavity C. Continue with step 13.
- **12.** If disconnecting the **DRLs**, remove the wire from the connector, wrap the terminal of the wire with electrical tape to prevent unintended connection, then secure the wire back to the harness with a tie-strap.
- 13. Connect the PECP connectors.
- **14.** Position the instrument panel and install the screws. If the steering column was lowered, position it into place, and tighten the steering column capscrews 17 lbf·ft (23 N·m).
- 15. Connect the batteries.
- **16.** Verify correct operation of the lights.

Vehicles with Star Gauge Dash, Built Since February 2002

- **1.** Shut down the engine, set the parking brake, and chock the tires.
- **2.** Disconnect the negative leads from the batteries.
- access.
- Center (ECC).
- installation.
- harness with a tie-strap.
- 8. Connect the **PECV** connector to the left-hand side of the **ECC**.
- 9. Disconnect the dark gray PECP connector from the left-hand side of the ECC.
- 10. Find wire HL08H (this wire may be HL05B in later models) in cavity G, then tag the wire with that location for future installation, if desired.
- 11. If connecting DRLs, locate wire HL05H (this wire may be HL05B in later models); the wire should be folded back and taped off in the harness. Remove the tape and install wire HL05H or HL05B into cavity G. Continue with step 13.
- **12.** If disconnecting the DRLs, remove the wire from the connector, wrap the terminal of the wire with electrical tape to prevent unintended connection, then secure the wire back to the harness with a tie-strap.
- 13. Connect the PECP connector to the left-hand side of the ECC.
- **14.** Position the instrument panel and install the screws. If the steering column was lowered, position it into place, and tighten the steering column capscrews **17 lbf·ft (23 N·m)**.
- 15. Reconnect the batteries.
- **16.** Verify correct operation of the lights.

3. Remove the four screws that secure the instrument panel, then pull the top of the panel forward to access instrument panel wiring. On vehicles with fixed steering columns, remove the bolts that hold the steering column to the dash assembly to lower the steering column for

4. Disconnect the light grav PECV connector from the left-hand side of the Electronic Control

5. Find wire LB08A in cavity A10, then tag the wire with that location for possible future

6. If connecting the DRLs, locate wire **LB08A**; the wire should be folded back and taped off in the harness. Remove the tape and install wire **LB08A** into **cavity A10**. Continue with **step 8**. 7. If disconnecting the DRL, remove the wire from the connector, wrap the terminal end of the wire with electrical tape to prevent unintended connection, then secure the wire back to the

Western Star Bodybuilder Book: Revision 3.2b Lighting Mods and Harness Repair

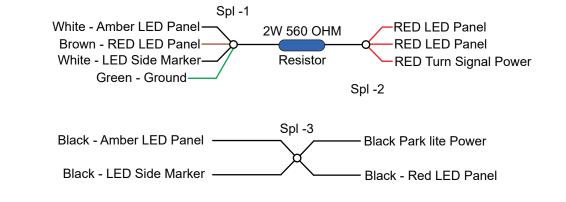

Western Star Trucks turn signal switches are equipped with a brake override circuit. This circuit is designed to deactivate the 4-way flashers when the brakes are applied. In some vocations, customers prefer that the 4-way flashers remain flashing during use of the service brakes. To disable this feature, the red jumper wire located in the turn signal switch housing, used to activate this circuit needs simply to be cut and the ends taped or heat shrunk to remove this function.

Both methods of wiring comply fully with Canada and USA regulations.

Installing Aftermarket LED Tail lights

Adding LED Tail Lights requires the addition of a 2 W 560 OHM resistor to ensure that the system consumes enough amperage for the system to function properly. Use the splice instructions below for installation of the aftermarket resistor.

Guidline For Repairing

Repair

Less than 20% of the harness is damaged. If the wire damage is greater than 6 inches (15 cm), an overlay harness can be added to replace the section of dama wire.

Wire is smaller than 12-gauge.

The harness is not readily available, or shipping will t longer than one week.

Wire insulation is cracked due to excessive heat from an external source. Repair is recommended if the damage is isolated to one section of the wire.

There is a clean cut to the wire, corrosion is wicked n more than 1 inch (2.5 cm) from the terminal end. If the damaged area is over 6 inches (15 cm), the harness can be repaired by adding overlay wiring over the damaged area.

NOTE: If damage exceeds 1 inch (2.5 cm) from the terminal end, a guality repair may require adding a jumper wire to end, a quality repair may require addi a jumper wire to create enough slack in the wire. If adding extra splices stretches the wire too tightly it can degrade the integrity of the harness.

Two harnesses are affected. For example, M2 24 pin lever lock connector (23-13144-010 and 23-13144-00 is corroded on both sides. Also, if the harness has minimal corrosion wicked up the wire, the connector can be re-pinned

If the damaged area is over 6 inches (15 cm), the harness can be repaired by adding overlay wiring over the damaged area.

For complete information see Guidelines for Repairing or Replacing an Electrical Harness - Service Bulletin 54-61 in the Western Star Service Manual

or Replacing a Harness		
	Replace	
e a ed	More than 20% of the harness is damaged.	
	Wire is 12-gauge or larger.	
take	The harness can be obtained in less than a week.

Western Star Bodybuilder Book: Revision 3.2b

Revisions

Changes Made

Revision 3.2 - August 2018

- Revision page added.
- 4700 Enhanced model information added.
- Added model designators to each page.
- Moved Air related systems to Section 1E.
- Moved all Switch related information to Section 1D.

Revision 3.2a - Feb 2020

- Updated Zonar Mounting image page 1A-8.
- Added secondary dash image page 1A-9.
- Revised Aux Disconnect Switch data codes page 1A-12.
- Revised EPA 2007 PX Module to 2005 page 1A-20.
- Three Cavity/Two Legged Fuse was Three Legged Fuse. Updated graphic to add power descriptions page 1A-26.
- Removed 4700 ENH designation, replaced with correct designations page 1A-27.
- Corrected paragraph header to show 4700L page 1A-27.
- Removed 4700 ENH designation, replaced with correct designations page 1A-28.
- Revised layout to incorporate additional images page 1A-28.
- Added connector table data for Cummins page 1A-30 and added note.
- Revised Mounting Bracket callout descriptions for A,B,C page 1A-30.
- Revised Page title, replaced Floor Track with Raceway page 1A-31 and 1A-32.
- Updated sales code descriptions page 1A-32.
- Added 44 ENH CIC Connector & Pinout information.
- Corrected grammar issue page 1A-36.

Revision 3.2b - July 2023

- Revised Flag Note 2 to include PDM Cavity and configurable fuses note page 1A-26.
- Revised note to reference correct page 1A-29.
- Revised note to reference correct page and added 44Y-001 Connector note to reference info 1A-30.
- Inserted page 1A-31 for TEMS Connector information and shifted all following pages.
- Moved note from Section 1B-17 Rev. 3.1 to page 1A-32. Revised callout's for clarity on right hand graphics.
- Updated Tables A, B and C to match Revision A of drawing 24-01974
